## Percent (\%) Error (a.k.a: Percent Deviation)

Compares your measurement with an accepted one. *ESRT

No measurement is perfect
Errors in value happen from carelessness or improper use of instrument.

Science has some accepted values
(e.g.: density $\mathrm{H}_{2} 0=1 \mathrm{~g} / \mathrm{cm}^{3} @ 4^{\circ} \mathrm{C}$ )

Percent Error $=\underline{\text { Difference between values } \times 100 \%}$ Accepted Value
e.g.: student measured mass of object $=127.5 \mathrm{~g}$, accepted value $=125.0 \mathrm{~g}$, what is $\%$ error?
$\%$ Error $=\frac{127.5 \mathrm{~g}-125.0 \mathrm{~g} \times 100 \%}{125.0 \mathrm{~g}}=\frac{2.5 \mathrm{~g}}{125.0 \mathrm{~g}} \times 100 \%=2.0 \%$
e.g.: measured volume $=1000 \mathrm{ml}$, actual volume $=2000 \mathrm{ml}$, $\%$ error $=$ ?
e.g.: $\%$ error $=10 \%$, accepted value $=10 \mathrm{~cm}$, measured value $=$ ?
